Trust Mechanics

APPROACH

modular structures

Built decoupled cross-platform interfaces powered by asynchronous micro-billing backends.

Cross-Promotion

Planning expert partnerships for launch-day consulting marathons.

Story-Driven Layout

From abstract concept to live micro-billing reality.

Multi-Sensory Experience

Clean visual alerts paired with conversational audio cues.

OUTCOMES

Validated the technical feasibility of real-time per-minute wallet deductions.

Completed end-to-end PRDs for the low-latency routing engine.

Designed a scalable, automated verification pipeline for onboarding advisors.

Established a responsive, fully decoupled Flutter-to-FastAPI architecture.

CHALLENGES

The primary challenge of FinTalk lies in orchestrating a high-stakes, two-sided marketplace where technical precision directly impacts user trust. On the engineering side, this meant architecting a low-latency routing engine and a real-time, asynchronous wallet deduction system that dynamically bills users every 60 seconds mid-consultation without introducing media lag or dropping connections.

Concurrently, from a product perspective, the hurdle was overcoming the marketplace "cold start" problem—balancing immediate advisor availability with user demand—while designing friction-free, automated verification workflows to strictly vet advisor credentials and build baseline platform trust.

FEEDBACK

FinTalk delivers a seamless, highly responsive advisory interface with flawless live billing, though users requested clearer upfront wallet balance warnings.

FINTALK CASE STUDY

KALVION

We embrace creativity, adapt across industries, and deliver thoughtful, quality-driven solutions tailored to people—not just markets.
