Technical Product Professional with an M.Tech in Computer Science and extensive experience leading AI/ML program strategy, product execution, and data-driven curriculum development. Proven track record of launching end-to-end technical initiatives, optimizing user engagement by up to 40%, and translating complex technical architectures (LLMs, FinTech) into high-value user experiences. Strong background in analysis and cross-functional stakeholder management.

Work Experience

AI & ML Engineer (Academics), ImaginXP

July 2025 - Present

- Owned the product roadmap for AI/ML educational offerings; utilized user feedback loops and market research to design data-driven feature sets, resulting in a 35-40% improvement in user problem-solving efficiency.
- I streamlined course content and adopted modern teaching methods, resulting in a 30% improvement in student engagement and understanding, as reflected in course feedback and exam performance
- Works on applied AI systems with a focus on Large Language Models (LLMs), including prompt engineering, fine-tuning, and retrieval-augmented generation (RAG).

Assistant Professor, COER University

Jan 2025 – July 2025

- Analyzed user engagement metrics and redesigned core platform content, driving a 30% increase in user retention and satisfaction scores.
- Actively collaborated with peers to enhance teaching methodologies, contributing to departmental growth and academic excellence.
- Consistently received positive student feedback for developing and teaching undergraduate and postgraduate MBA & M.Tech courses in Data Science, Machine Learning, Cybersecurity, and Strategic Information Systems. .
- Served as an academic advisor, guiding students in course selection, research projects, and career paths.

Teaching Assistant, LNMIIT Aug

2021 – May 2023

- Help professors with the preparation and presentation of course content, which consists of lectures, assignments, and tests.
- Oversee and mentor students in the lab, making certain they grasp how theoretical concepts apply in practice.
- Assess assignments, quizzes, and tests, and offer students constructive feedback to enhance their comprehension of the topic.
- Assist students with practical tasks and projects, aiding them in applying theoretical ideas to actual challenges.

Education

LNMIIT, Master of Technology | Jul 2021 - Aug 2023

Computer Science and Engineering | AI & ML

JISCE, Bachelor of Technology | June 2017 – May 2021

Information Technology

Technical Proficiency

Product Management & Methodology: Product Roadmapping, Product Requirement Documents (PRDs), User Persona Mapping, MVP Scoping, Agile/Scrum, User Journey Mapping.

Data Analytics & Insights: SQL, MongoDB, Tableau, Power BI, Advanced Excel, Statistics, Financial Analysis, Seaborn, Matplotlib.

AI & Machine Learning Architecture: Large Language Models (LLMs), RAG (RetrievalAugmented Generation), Fine-Tuning (LoRA), Deep Learning (CNNs), NLP, Scikit-learn, TensorFlow, Hugging Face.

Software Engineering & Core Frameworks: FastAPI, Django, Flutter, Python, C++, C, Rust (Beginner).

System & Business Concepts: Computer Organization & Architecture (COA), Behavioral & Economic Decision-Making Modeling.

Projects

FinTalk – A Real-Time Financial Micro-Consulting Marketplace (In Development)

- Product managed the end-to-end concept and development of a real-time, per-minute financial advisory app built with Flutter and FastAPI.
- Designed the product requirements (PRDs) for a low-latency chat/call routing engine and a dynamic, real-time per-minute wallet deduction system to ensure frictionless user-toexpert matching.
- Prioritized high-engagement marketplace features, including instant online/offline advisor discovery, live user ratings, and automated advisor verification workflows to build product trust and maximize user retention.

TinyLLM: From Scratch Tokenization to API [Project link](#)

Wanted to demonstrate a deep understanding of how models actually "think," building the pipeline from the ground up is the best approach.

- Instead of just calling an API, documented the creation of a specialized small-scale model pipeline.

Key Components:

- Tokenization: Implement a Byte Pair Encoding (BPE) tokenizer to understand how text is converted into numerical sub-words.
- Fine-Tuning: Using LoRA (Low-Rank Adaptation) to fine-tune a smaller open-source model on a specific domain, such as academic scheduling or legal jargon.
- Deployment: Wrap the model in a FastAPI backend to create a high-performance inference endpoint that could serve a mobile or web frontend.

Internship

Tradeshala | Capital Market Analyst Intern Sep 2023 – Nov 2023

- Conducted market research and user sentiment analysis using data analytics tools to identify market gaps and inform high-level product strategy.
- Leveraged Density platform for trade execution and integrated sentiment analysis to refine market predictions.
- Utilized advanced data analytics tools to collect and interpret financial data for actionable insights.

GRIP (Sparks Foundation) | Business Analytics Intern | Oct 2020 – Dec 2020

- Leveraged data-driven analytics tools to perform comprehensive product and market research, translating raw data into actionable insights for high-level feature strategy.
- Analyzed user metrics, behavioral data, and economic trends using advanced data analytics to identify product optimizations and drive user engagement.

Certifications

- Machine Learning with Python, Internshala
- Ethical Hacking: Introduction to Ethical Hacking, LinkedIn Learning

Thesis & Research

Behavioral and Economic Decision-Making Analysis Using Machine Learning

- Conducting interdisciplinary research integrating economics, psychology, and machine learning to study human decision-making behavior.
- The study focuses on modeling economic choices influenced by psychological factors such as risk perception, cognitive bias, and emotional response.
- Machine learning techniques (regression models, clustering, and neural networks) are used to identify behavioral patterns and predict decision outcomes. **Status:** Ongoing

Kinship Verification Using Facial Images

- Kinship verification using facial images involves determining the degree of relatedness between individuals based on their facial features.
- CNN, which is a deep learning technique, also used classification techniques like SVM and some mathematical formulas and techniques like Euclidean distance, norm, bi-metric learning and matrix
- Facilitating genetic research by verifying familial relationships in large datasets, which can aid in understanding hereditary traits and diseases.

Status: Completed

Soft Skills & abilities

- **Cross-Functional Leadership & Stakeholder Management:** Experienced in aligning cross-functional teams, managing diverse stakeholder expectations, and driving program operations smoothly from inception to delivery.
- **Product Communication & Presentation:** Adept at translating complex AI/ML architectures, algorithmic structures, and technical data into clear, actionable, and usercentric insights for both technical teams and business stakeholders.

- **Agile Execution & Strategic Planning:** Proven track record of managing timelines, structuring operational roadmaps, and optimizing resource allocation to ensure high-quality product delivery.
- **Data-Driven Problem Solving:** Strong analytical thinker skilled at identifying operational bottlenecks, analyzing user metrics, and implementing data-backed solutions to optimize product and program efficiency.
- **Adaptability & Growth Mindset:** Demonstrated ability to rapidly master and integrate emerging technologies, technical tools, and modern methodologies into fast-paced working environments.
